

The [Unified Index](#) is a temporary copy of some of your data, optimized for quick retrieval.

Step 1

tiki-admin.php?page=search -> General Settings -> Don't index non searchable fields

Indexing will skip adding all tracker fields that are not marked as "searchable". This will free index space but also make it impossible to use those fields in search index queries.

Preference name: unified_exclude_nonssearchable_fields

Step 2

Then, go to the list of fields in each tracker, and toggle the value for the "Search" column.

Step 3

[Rebuild Unified Index](#)
