

Plugin Code

This [wiki plugin](#) is used to display any source code (including wiki syntax) on a page without it being processed. The code is displayed in a gray box in a fixed-width monospaced font. A title can be added to the box and line numbers added. Syntax highlighting is also available, since Tiki7 using [CodeMirror](#) and using GeSHi before that.

Parameters

Tiki Doc From Code error: code not found

Syntax highlighting

To activate syntax highlighting and enjoy most of the options (lines number, colors, etc), the Code editor (CodeMirror) feature must be enabled at Control Panels > Editing and Plugins > General Settings (tab) > Features (pane).

See the list of [CodeMirror](#) supported languages that can be used for the colors parameter.

Example

PHP with line numbers

This code:

```
{CODE(colors="php")} <?php $menu = $menubar->getHomeMenu(); if($menu->link != "") { print "\t<td width=\"7%\" valign=\"top\">\n"; $menu->printMenu(); print "\t</td>\n"; } {CODE}
```

Would produce:

```
<?php $menu = $menubar->getHomeMenu(); if($menu->link != "") { print "\t<td width=\"7%\" valign=\"top\">\n"; $menu->printMenu(); print "\t</td>\n"; }
```

Tiki syntax highlighting

Tiki syntax is supported too.

This code:

```
{CODE(colors="tiki")} {img attId="57|58|59" desc="desc" alt="Sample Images" thumb="y" stylebox="float: left; margin-right:10px"} {CODE}
```

Would produce:

```
{img attId="57|58|59" desc="desc" alt="Sample Images" thumb="y" stylebox="float: left; margin-right:10px"}
```

Legacy GeSHi Documentation (deprecated in Tiki8)
