

# Plugin Regex

Use this [wiki plugin](#) to use a "regular expression" style search expression from another wiki page to search for and replace text in the body of the plugin (between the REGEX tags).

## Parameters

Tiki Doc From Code error: regex not found

To use this plugin:

1. Place the search pattern (enclosed with forward slashes) and replacement text on a separate wiki page, separated by two colons ( : : ). For example:  
`/search pattern/::replacement text`
2. Then enter that page name as the `pageName` parameter value of the plugin.
3. The text in the body of the plugin (between the REGEX tags) will be searched and each match of the search pattern will be replaced by the replacement text.

This plugin mimics the [preg\\_replace](#) PHP function. For advanced search patterns, see <http://www.php.net/manual/en/reference.pcre.pattern.syntax.php> in the online PHP manual or simply search the internet for "regular expression syntax".

## Example

*This code:*

```
{REGEX(pageName="PluginRegex Example")}I had a horrible day.{REGEX}
```

*Plus this syntax on a separate wiki page called [PluginRegex Example](#):*

```
/horribl/::wonderful
```

*Would produce:*

I had a wonderful day.
