

Let's create an example:
Just go to tiki-admin_modules.php
Click on the tab "Custom Modules", if not there by default.

Create a new Custom module:

lefthand side

Title: My new Module

Name: my_new_module

righthand side

don't touch anything there

bottom in the code area

paste simple HTML:

 This is
my
module in
the footer

Apply!

Go to the left tab "Applied Modules" and

- find the button "Add Module" and click on it
- search for the module "my_new_module" and click on it
- apply the module to the footer and

put the following parameter into the modules code area:

nobox=y

Now let's change the code and add some SmartySyntax from themes.tiki.org/Template+Tricks

So please go back to the second tab "Custom Modules":

```
 I am  
{$user}  
{if $group  
eq  
"Admins"  
}and I am  
in the  
Group  
{$group}  
{/if}
```

Apply and see what's changed

Now Wikisyntax:

Go to the second tab "Custom Modules" again, to edit you module.

Delete the content of the code area and put in this:

```
{wiki}{literal} {SPLIT(colsize=30%|5%|65%)} __I can use__ "WikiSyntax" and %%% WikiPlugins --- ---  
{wiki}{literal}{module module=>menu, id=>43, nobox=y}{/literal}{/wiki} {SPLIT}{/literal}{/wiki}
```

Apply!
and see, what happens.
