

File Gallery for Images

Since Tiki3, file galleries have more features to support image galleries also from your local images. For images already elsewhere in internet, use the simple `{img src=http://domain/foo.jpg}` as usual.

Enable the setting

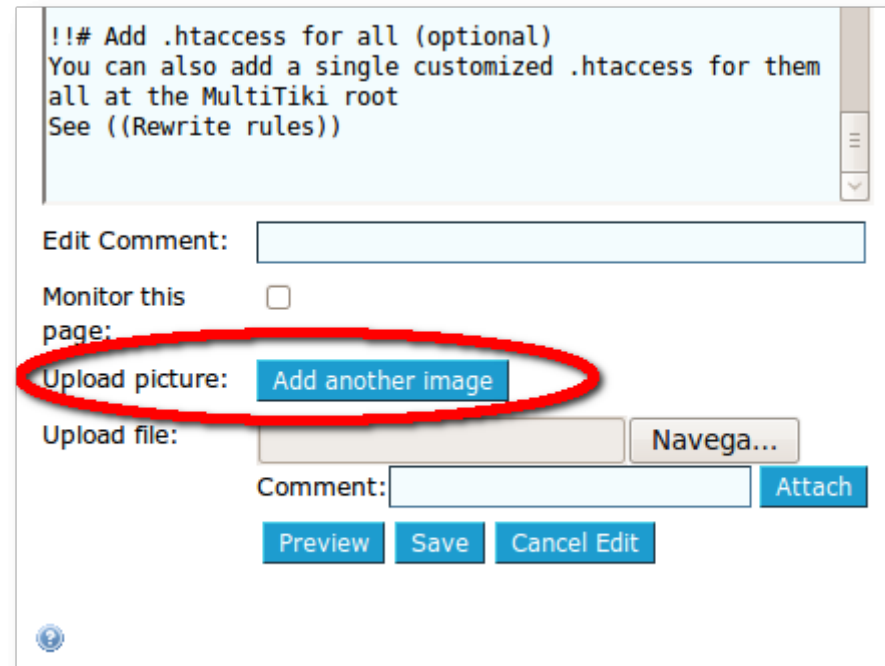

First an admin has chosen file galleries to manage images also. This option can be enabled at "Admin home > Editing and Plugins > General settings" (**tiki-admin.php?page=textarea**): "Use File Galleries to store pictures".

Let's see an example of this new usage of the file galleries.

1.1. Upload an image

1.1.1. Through editing a wiki page

In Tiki3, you could do that through the following option of the wiki edit interface:

!!!# Add .htaccess for all (optional)
You can also add a single customized .htaccess for them
all at the MultiTiki root
See ((Rewrite rules))

Edit Comment:

Monitor this ☐
page:

Upload picture: [Add another image](#)

Upload file: [Navega...](#)

Comment: [Attach](#)

[Preview](#) [Save](#) [Cancel Edit](#)

Starting in Tiki4, and being improved in Tiki5, the edit interface has been revamped and you can open the form to upload images through the appropriate icons in the toolbar area on top of the editing area of the wiki page:  

The first one,  , opens the plugin helper to add references to images available on Internet somewhere (inside or outside tiki).

The second one,  , opens the interface to upload images. By default, that interface shows in the basic mode to allow uploading a single image:

However, if we click on the appropriate button on top of the previous type of window, we will see the advanced interface to upload several files with images at once or even a single compressed zip file with many images to be processed in batch mode, as well as selecting the user or categories to link those images to.

1.1.2. Directly through file galleries

http://doc.tikiwiki.org/tiki-list_file_gallery.php?filegals_manager=editwiki

File Galleries

Upload File **SlideShow**

Tip

Be careful to set the right permissions on the files you link to.

Keep gallery window open ☐

Find Number of displayed rows **Go**

File Galleries

- File Galleries
 - Images for slideshows
 - Images for the Documentation pages

| | | T | Name | Size | Created / Uploaded | Last Modified | Files | Hits | |
|--------------------------|--|---|------------------------------------|-----------|--------------------|-------------------|-------|------|--|
| <input type="checkbox"/> | | | Images for the Documentation pages | 202.04 KB | Fri 01 May, 2009 | Tue 05 May, 2009 | 16 | 61 | |
| <input type="checkbox"/> | | | Images for slideshows | 0 B | Wed 05 May, 2004 | Wed 29 Apr., 2009 | 0 | 10 | |

Perform action with checked:

1.2. Select the image/s to upload from disk

Chose file (step 1 in the image below), file gallery to set the image to (step 2), optional parameters (step 3, quite self explained), and click on upload (step 4).

The screenshot shows a web form titled "Upload File" with a help icon. The form contains several fields and buttons, with red annotations indicating a four-step process:

- *3**: A red asterisk and the number 3 are placed next to the "Upload File" title.
- 1**: A red circle with the number 1 is around the "Navega..." button in the "Upload from disk:" field.
- 2**: A red circle with the number 2 is around the dropdown menu in the "File Gallery:" field, which currently shows "Images for the Documentation pages".
- 4**: A red circle with the number 4 is around the "Upload" button at the bottom left.

Other elements in the form include:

- A "List Galleries" button.
- Fields for "File Title:" and "File Description:", each marked with a red asterisk.
- An "Upload from disk:" field.
- An "Unzip zip files" checkbox, also marked with a red asterisk.
- A "Select Categories" button, marked with a red asterisk.
- An "Add File" button, marked with a red asterisk.
- A footer note: "Maximum file size is limited to: 10 MB".

1.3. Get the link and syntax to use that image

Once the image is successfully uploaded, you will see a screen like the following:

There you can click on the button "**Additional info**", and it will display the links and syntax you need to copy in order to re-use that image in your wiki page, forum, tracker, etc., or in external web sites.

Upload File

List Galleries

wikistructure_00.png (67.37 Kb)

Additional Info

(Hide)

You can download this file using:

```
http://doc.tikiwiki.org/tiki-download_file.php?fileId=22
```

You can link to the file from a Wiki page using:

```
[tiki-download_file.php?fileId=22|wikistructure_00.png (67.37 Kb)]
```

You can display an image in a Wiki page using:

```
{img src="tiki-download_file.php?fileId=22&preview"
alt="wikistructure_00.png (67.37 Kb)"}

```

You can link to the file from an HTML page using:

```
<a href="http://doc.tikiwiki.org/tiki-
download_file.php?fileId=22">wikistructure_00.png (67.37 Kb)</a>

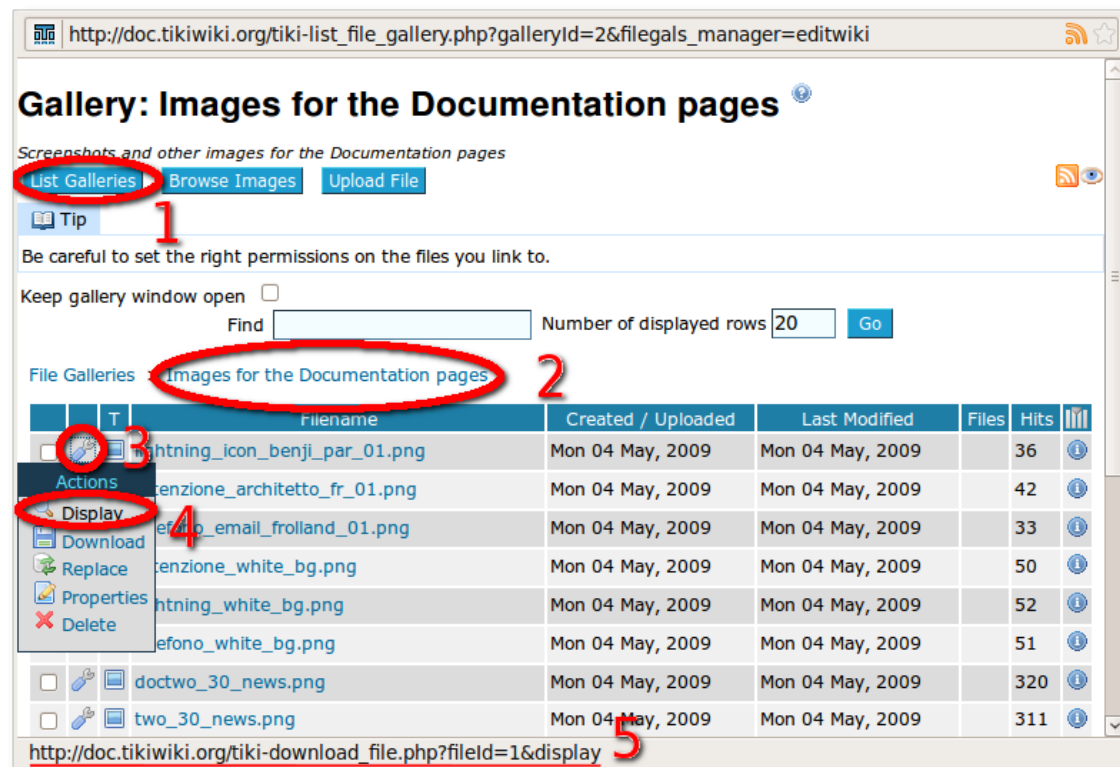

```

Proceed as usual then onwards. Keep in mind that if you add png images with transparencies, then many url's shown by tiki from file galleries have the **&preview** or **&thumbnail** attached to them, and thus, they will be converted to jpg (without transparency) by GD on the fly for that modified smaller display. Just remove that param if you wish and the png will be shows as png.

You can also add the extra param "class=reflect" for nice visual effects if you have JQuery and its corresponding JQuery plugin enabled in your site.

Use existing images

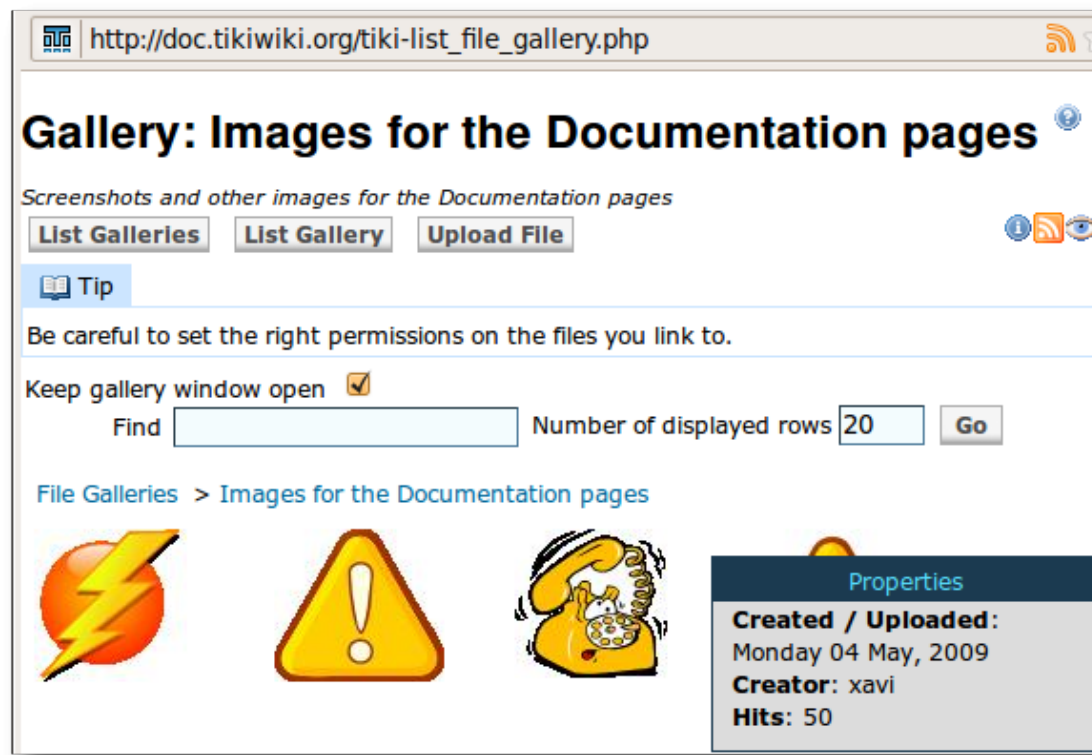

Moreover, in order to use existing images from file galleries you can just use the url of the file, for instance, and use the IMG tag as usual:

ou will also have the option to display the image in preview mode when passing your mouse pointer over each image

Or you can use the new image browser within the file galleries, which will allow you to, while editing a wiki page, click on an image from the image browser from the file gallery window and insert the needed code to display where you have your cursor.

Additional settings and Parameters

Wiki markup to be passed to the

When editing a wiki page and uploading an image via the img/image wikiplugin, Tiki will insert the image as a thumbnail by default. This behavior can be customized per gallery. Just go to the File Gallery of your choice, edit the gallery and look for the setting labeled:

“Wiki markup to enter when image selected from file gallery manager” update the default wiki code to whatever you prefer.

For example, to insert by default images at full size instead of thumbnails, set the default to:

Change the default for inserting an image on a wiki page

```
{img fileId="%fileId%"}
```
