

Google WebFonts

It's quite easy to use Google Fonts in Tiki!
See also: PluginFont

How to configure

The screenshot shows the Tiki theme configuration interface with the 'Customization' tab selected. The 'Theme Generator (Experimental)' section is disabled. The 'Custom Codes' section is active, showing the 'Custom CSS' field with the following code: `html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }`. Below the code field is a 'Change Highlighter' button and an 'Experimental: CSS assistant (work in progress - click the x to remove)' notification. The 'Custom HTML <head> Content' section is also visible, containing the code: `<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>`.

To affect most of the text

`html > body, *:first-child + html body`
