

# Plugin Regex

Use this wiki plugin to use a "regular expression" style search expression from another wiki page to search for and replace text in the body of the plugin (between the `REGEX` tags).

# Parameters

Perform a regular expression search and replace

*Introduced in Tiki 1. Required parameters are in **bold**.*

[Go to the source code](#)

*Preferences required: wikiplugin\_regex*

Parameters	Accepted Values	Description	Default	Since
(body of plugin)		Each line of content is evaluated separately		
<code>pageName</code>		Name of page containing search and replace expressions separated by two colons. Example of syntax on that page: <code>/search pattern/::replacement text</code>	<code>pageName</code>	1

To use this plugin:

1. Place the search pattern (enclosed with forward slashes) and replacement text on a separate wiki page, separated by two colons ( `::` ). For example:

`/search pattern/::replacement text`

2. Then enter that page name as the `pageName` parameter value of the plugin.
3. The text in the body of the plugin (between the `REGEX` tags) will be searched and each match of the search pattern will be replaced by the replacement text.

This plugin mimics the `preg_replace` PHP function. For advanced search patterns, see

<http://www.php.net/manual/en/reference.pcre.pattern.syntax.php> in the online PHP manual or simply search the internet for "regular expression syntax".

# Example

*This code:*

```
{REGEX(pageName="PluginRegex Example")}{I had a horrible day.}{REGEX}
```

*Plus this syntax on a separate wiki page called PluginRegex Example:*

```
/horrible/:wonderful
```

*Would produce:*

I had a wonderful day.
