Signature image width (default is 400px)

EXAMPLES

This code:

{signature}

Would produce:

SCREEN CAPTURED DEMONSTRATION

https://sourceforge.net/p/tikiwiki/code/77409

MISCELLANEOUS

It uses https://github.com/szimek/signature_pad

We have pushed a new wikiplugin_signature, which allows to draw a signature and save it as an image. How to use: {CODE()} {signature} {CODE} Additional params: * name - Like the "person" who should sign (example: customer). The name is displayed in the signature button. * width - The signature image width (default is 400px). * height - The signature image height (default is 200px) * align - Where to position the signature (default is left). After save, the image is stored within the plugin content as

image/png base64. The plugin is also ready for PDF export since it uses images after signature is saved. Caveats: Who signs needs permission to edit the tiki-page. Code changes delivered to master: https://gitlab.com/tikiwiki/tiki/-/merge_requests/608
