

Google Web Fonts

It's quite easy to use [Google Fonts](#) in Tiki!

See also: [PluginFont](#)

How to configure

The screenshot shows the 'Customization' tab of a Tiki theme configuration interface. It features several tabs: 'Theme', 'General Layout', 'Shadow layer', 'Pagination', 'UI Effects', and 'Customization'. The 'Customization' tab is active and contains the following sections:

- Theme Generator (Experimental):** A checkbox labeled 'Theme Generator' is present, accompanied by a blue circular icon and a yellow warning triangle.
- Custom Codes:** A section with an information icon and a refresh icon. It contains a text area for 'Custom CSS' with the following code:

```
html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }
```

 Below this text area is a blue button labeled 'Change Highlighter'.
- Experimental: CSS assistant (work in progress - click the x to remove):** A small red icon followed by the text 'Experimental: CSS assistant (work in progress - click the x to remove)'.
- Custom HTML <head> Content:** A section with an information icon and a refresh icon. It contains a text area with the following code:

```
<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>
```

To affect most of the text

```
html > body, *:first-child + html body
```
