

Module Settings Interface

After selecting a module to assign or edit (see [Assigning Modules](#)) or when using [PluginModule](#) to display a module in a page or other feature, there are various settings available for configuring the module. This page explains how the interface works for making those settings. See the next page, [Module Settings Parameters](#) for information on the module parameters themselves.

Admin Modules Page

Beginning with [Tiki7](#), parameters are set in a form with a separate input field for each setting, grouped by tabs: Basic, Module (if applicable - for parameters specific to that module), Appearance, Visibility. Mouse over the screen shots below to see examples:

The screenshot shows two examples of the Admin Modules Page. The top example is for the 'rsslist' module, and the bottom example is for the 'featured_links' module.

Edit this assigned module: rsslist

This screenshot shows the configuration for the 'rsslist' module. It includes tabs for Basic, Module, Appearance, and Visibility. A tooltip indicates that in versions 4x - 6x, parameters are set in a form with separate input fields for each setting. Another tooltip for version 3x and prior shows that parameters are set in a single input field using a "url parameter format".

Assign new module

This screenshot shows the configuration for the 'featured_links' module. It includes fields for Module Name (set to 'featured_links'), Position (set to 'Left'), Order (set to '1'), Cache Time (secs) (set to '0'), Rows (set to '10'), and Parameters (set to 'notitle=y&lang=fr'). A red arrow points to the 'Parameters' field, with a tooltip stating 'Parameters set in "url parameter" format'. The 'Groups' section shows 'Admins', 'Anonymous', and 'Registered' selected.

PluginModule

Modules can be displayed in wiki pages and other Tiki features (blogs, articles, etc.) using [PluginModule](#). Use the parameter names below (not the labels) to set parameters for the plugin using the syntax explained on [PluginModule](#) and the documentation page for the individual module (see [Index of Modules](#) for links to the individual pages).

Where To Go From Here

Now that you know how the interface works, go to the next page, [Module Settings Parameters](#), to learn about the module parameters themselves.
