

Module Whats related

The `whats_related` [module](#) uses the [Categories](#) system to show you a list of items in the same category as the item you are viewing. Articles, Blogs, and wiki pages can all be shown in this module.

Whats related
wiki page: Autos
article: I really like my car
blog: This is my auto blog

Parameters

Lists objects which share a category with the viewed object.

[Go to the source code](#)

Preferences required: `feature_categories`

Parameters

no parameters

Questions:

- Are there parameters that control which types of documents are shown, e.g. only wiki pages?
- Why do article hits show the header text instead of the article title?
