    HTTP header public-key-pins

help

default
    n

description
    The public-key-pins header associates a specific cryptographic public key with a certain
    web server to decrease the risk of MITM attacks with forged certificates. If one or several
    keys are pinned and none of them are used by the server, the browser will not accept the
    response as legitimate, and will not display it.
